1.Continue from the code we did together this morning by creating the model and its classes. (You can simply copy the code from me)

2.Look into Faker library and see how it works. (Docs:https://faker.readthedocs.io/en/master/)

3.Create a script that generate dummy data(Topic, AccessRecords, Webpages) and save it to the database.

4.Check if it is any generated data by logging in to the Admin interface.

NOTE: You are not allowed to add data manually in the Admin interface

5. Grab the access records from the database and visually present that in a table in html.
