Django Lab 6

Now that I have introduced you guys to templates inheritance, we are going to do a simple application using it.

For example, creating a simple signup page for our users with template inheritance. So, the user should be able to signup and be greeted with thank you for signup if signup was successful.

1.Create a new django project or re-use what you already have.

2.Create the following html files: base.html, index.html, signup.html

3.Create a base.html file and have bootstrap navbar in it and a footer that is going to be your base.

4.Remember to extend base.html to index.html and signup.html page.

5. Save the data entered by the user in signup.html file to the database.

6. Optional: Create a thank you page and tell the user "Thank you for signup" if the signup was successful.

Good luck!
